                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC therapeutically to induce apoptosis in mammalian cells, and so is useful conditions associated with decreased apoptosis e.g. cancer. CC Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor CC (TNFR). TNF cytokines can induce apoptosis, thought to be initiated by binding to TNFRs, and Apo-2 triggered caspase-dependent apoptosis. It CC can be used to identify agents activating Apo-2, useful to treat CC mammalian cancer cells, and to produce Apo-2 chimeras useful to treat CC mammalian cancer cells, and to produce Apo-2 chimeras useful containing immunoglobulin sequences can be inhibit apoptosis) or diagnostically (e.g. those comprising an epitope CC inhibit apoptosis) or diagnostically (e.g. those comprising anti-tag CC antibodies). It can be used to produce antibodies which can be combined CC with a (particularly pharmaceutically acceptable) carrier in compositions CC comprising first and second Apo-2 antibodies). Agonistic (especially CC single-chain) antibodies can be administered to induce apoptosis in CC commalian cancer cells, and antagonistic antibodies used to block CC excessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 CC expression in cells/tissues and in Apo-2 antibody, designated 24C4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 binds Apo-2 ligand (Apo-21). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cancer, to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and in affinity purification of Apo-2 from recombinant cell culture or natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a single-chain Apo-2 antibody, decaded, which is isolated from a phage library. It is believed that Apo-2 is a member of the tumour necrosis factor receptor (TNFR)

The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating antibodies, in affinity purification techniques, and in competitive-type receptor binding assays when labelled with, for instance, radioiodine, enzymes, or fluorophores. Nucleic acids encoding Apo-2 may be used as a diagnostic for tissue-specific typing. This is the amino acid sequence of the single chain antibody fragment (svFv) 24C4 used in the preparation of anti-apo-2 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Apo-2

                                                                                                                                The present invention describes human Apo-2 can be used therapeutically to induce apoptosis in mammalian cells, and so is useful to treat conditions associated with decreased apoptosis e.g. cancer. CC Apo-2 is believed to be a new tumour necrosis factor (TWF) receptor CC (TWFR). TWF cytokines can induce apoptosis, thought to be initiated by binding to TWFRs, and Apo-2 triggered caspase-dependent apoptosis. It can be used to identify agents activating Apo-2, useful to treat CC therapeutically (e.g. those containing immunoglobulin sequences can be inhibit apoptosis) or diagnostically (e.g. those comprising an epitope trag polypeptide allow Apo-2 detection and purification using anti-tag comprisition approached to produce antibodies which can be combined CC with a (particularly pharmaceutically acceptable) carrier in compositions cor used to produce dimeric molecules (especially homodimeric molecules comprising first and second Apo-2 antibodies). Agonistic (especially Single-chain) antibodies can be administered to induce apoptosis in mammalian cancer cells, and antagonistic antibodies used to block cexcessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 cexpression in cells/tissues and in Apo-2 antibody, designated 16E2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
                                                                      16E2, which is isolated from a phage library. It is believed that Apo-2 is a member of the tumour necrosis factor receptor (TNFR) family. Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 binds Apo-2 ligand (Apo-2L). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cance to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and i affinity purification of Apo-2 from recombinant cell culture or nature
                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids encoding an Apo-2 ligand, useful for activating stimulating apoptosis in cancer cells, thus especially useful in 1 treatment of cancer, or in enhancing immune-mediated cell death .
                                                                                                                                                                                                                                                                                                                                The present sequence represents a single-chain Apo-2 antibody,
                                                                                                                                                                                                                                                                                                                                                                                  Example 14; Fig 16; 68pp;

Sequence

309

B

The invention describes a novel isolated Apo-2 polypeptide. The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antibodies, in affinity purification techniques, and in competitive-type receptor binding assays when labelled with, for instance, radioiodine, enzymes, or fluorophores. Nucleic acids encoding Apo-2 may be used as a diagnostic for tissue-specific typing. This is the amino acid sequence of the single chain antibody fragment (svFv) 16E2 used in the
Human Apo-2 polypeptide inducing apoptosis - useful to treat conditions linked with decreased apoptosis e.g. cancer, and pantibodies to increase or decrease apoptosis

binding to TNFRs, and Apo-2 triggered casspase-dependent apoptosis. It can be used to identify agents activating Apo-2, useful to treat mammalian cancer cells, and to produce Apo-2 chimeras useful therapeutically (e.g. those containing immunoglobulin sequences can be inhibit apoptosis) or diagnostically (e.g. those comprising an epitope tag polypeptide allow Apo-2 detection and purification using anti-tag antibodies). It can be used to produce antibodies which can be combined with a (particularly pharmaceutically acceptable) carrier in compositions or used to produce dimeric molecules (especially homodimeric molecules comprising first and second Apo-2 antibodies). Agonistic (especially single-chain) antibodies can be administered to induce apoptosis in mammalian cancer cells, and antagonistic antibodies used to block excessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 antibodies may also be used diagnostically e.g. to detect Apo-2 expression in cells/tissues and in Apo-2 antibody, designated 20E6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes human Apo-2. Apo-2 can be used therapeutically to induce apoptosis in mammalian cells, and so is useful to treat conditions associated with decreased apoptosis e.g. cancer. Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor (TNFR). TNF cytokines can induce apoptosis, thought to be initiated by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a single-chain Apo-2 antibody, designate 2026, which is isolated from a phage library. It is believed that Apo-2 is a member of the tumour necrosis factor receptor (TNFR) family. Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 binds Apo-2 ligand (Apo-2L). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cancer to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and in affinity purification of Apo-2 from recombinant cell culture or natural sources.
     Single chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids encoding an Apo-2 ligand, useful for activating stimulating apoptosis in cancer cells, thus especially useful in treatment of cancer, or in enhancing immune-mediated cell death

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a novel isolated Apo-2 polypeptide. The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating antibodies, in affinity purification techniques, and in competitive-type receptor binding assays when labelled with, for instance, radioiodine, enzymes, or fluorophores. Nucleic acids encoding Apo-2 may be used as a diagnostic for tissue-specific typing. This is the amino acid sequence of the single chain antibody fragment (svFv) 20E6 used in the preparation of anti-apo-2 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Apo-2 polypeptides and polynucleotides, useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, quantitative diagnostic assays, or in generating antibodies aga Apo-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apo-2; tumour necrosis factor family; TNFR; gene therapy; apoptosis; tissue-specific typing; affinity purification; competitive-type receptor binding assay; mouse; 20E6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                           Q
                                                                                                                                                                           This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have C cytostatic, immunosuppressive, immunostimulant, immunomodulatory, C antirheumatic and antiAlDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in C biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and c diseases, e.g. systemic lupus crythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP4728 represent the invention

                                                                                                                                    B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be
administered to treat diseases associated with aberrant BLyS expre and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). BLyS is a member of the CC tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have CC cytostatic, immunosuppressive, immunostimulant, immunomodulatory, CC antirheumatic and antiAIDS activity and can be used in vaccines to CC inhibit the expression and activity of BLyS. The antibodies bind to BLyS in CC biological samples and may be used in this way to diagnose disease CC associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression CC diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, CC immunodeficiency (e.g. common variable immunodeficiency (CVID) and CC the antibodies and fragments of the antibodies described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc may include cytotoxins such as ricin, abrin or Pseudomonas exotoxin;
cc radionuclides; ligands such as growth factors; therapeutic agents such
cc as vinblastine, vindesine or melphalan; ribozymes; or antisense
cc molecules. The antibodies may also be used for in vivo or in vitro
cc detection and/or quantitation of the c-erb-2 receptor and thus diagnosis
cc and/or localisation of cancers characterised by expression of c-erb-2.
cc Although antibodies have previously been used to target tumour cells,
cc their success has been limited. The utility of prior art antibodies has
cc been hampered by the paucity of tumour specific antibodies, antibody
cc immunogenicity, low binding affinity, and poor tumour penetration.
cc tumour specific human antibodies were available. However, the production
cc tumour specific human antibodies were available. However, the production
cc of human monoclonal antibodies using conventional hybridoma technology
cc has proven difficult. Also, most of the antibodies produced react with
cn antipoles that are also common to non-malignant cells, which makes them
cn unsuffable for use as tumour-targetting molecules may antibodies them

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an internalising humanised antibody, scFv F5, which specifically binds to the extracellular domain of the c-erbB-2 receptor, the protein product of the HER/neu oncogene. The scFv F5 antibody binds to the epitope of the c-erbB-2 receptor that is bound by F5 antibodies. On binding the c-erbB-2 receptor, the antibody is transported into the cell. The c-erbB-2 receptor is a marker protein which is overexpressed by 30-50% of breast carcinomas and other adenocarcinomas, and thus provides a useful cell surface marker for specifically targetting tumour cells.
